related to the zinc transporter subfamily. requirements of the invention are useful for treating a disease or polypeptides of the invention are useful for treating a disease or polypeptides of the invention are useful for treating also provide a target for diagnosing a disease or predisposition to disease mediated by the peptide, and in pharmacogenomic analysis. The peptides are also useful for treating a disorders characterised by absence of, inappropriate or unwanted expression of the protein. The nucleic acids are also useful in drug screening assays and as a target for treatment by the compounds identified through drug screening. The invention also provides vectors for gene therapy in patients with aberrant expression of the gene encoding the transporter protein. The gene of the invention of the gene encoding the transporter protein the kidney, testis, heart, has been found to be expressed in humans in the kidney, testis, heart, the human transporter protein transporter t

(I) have cytostatic contivity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For cexample, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome content affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) concerns and caids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting content. (I) proteins and polynucleotides may be used to prevent. (C) cancers and cancer metastases of haematopoietic related diseases, especially concers and cancer metastases of haematopoietic antigen genomic consert sequences from the present invention. AAK54942 to AAK94950 and AAM82169 concerns received cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC (GCA), by detecting the level of expression of gene(s) (os) Identified by CC (GC), where differential expression level in an unactivated GC (GC), where differential expression of GS is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent capable of modulating GC or chronic) in a tissue, an allergic response in a subject, exposure of a complet to a pathogen or sterile inflammatory disease using the gene expression profile: (3) detecting (M4) an inflammation (especially CC chronic) in a tissue, an allergic response in a subject, exposure of a complete to a pathogen or sterile inflammatory disease, by detecting the complete to a pathogen or sterile inflammatory disease, by detecting the complete to a pathogen or sterile inflammatory disease, by detecting the complete to a pathogen or sterile inflammatory disease, by detecting the complete to a pathogen or sterile inflammatory disease, by detecting the complete to a pathogen or sterile inflammatory disease, by detecting a tissue, and inflammation (especially chronic) or in a tissue, and inflammation in a sample of the tissue of subject to a pathogen or sterile inflammatory disease, by contacting a tissue having condulating GA; M3 is useful for detecting an agent capable of modulating GCA; M2 is useful for complete of a subject, exposure of a subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflammatory disease, and the subject to a pathogen or sterile conflamentory disease, and the subject to a pathogen or s The invention relates to detecting (M1) granulocyte (GC) Sequence 128978 BP; 35134 A; ftp.wipo.int/pub/published\_pct\_sequences the level of 31020 C; 29358 G; 33466 T; 0 expression of gene(s) C) activation
(Gs) identified γģ

          The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a DNA encoding a protein fragment of the invention.
                                                                                                                                                                               Nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences o number of human reproductive system related antigens. These can be in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoprotein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a DNA encoding a protein fragment of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                         (GCA), by detecting the level of expression of gene(s) (GS) identified DNA chip analysis as given in the specification, and comparing the expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gen(s) from Gs, where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           granulocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fungal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; glomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disease; Crohn's disease; ulcerative colitis; periodontal disease;

CC from GS in the tissue. MI is useful for detecting GCA, M2 is useful for
CC modulating GA; M3 is useful for screening an agent capable of modulating
CC GCA preferably in an inflammation in a tissue; M4 is useful for
CC response in a subject, exposure of a subject to a pathogen or sterile
CC response in a subject, exposure of a subject to a pathogen or sterile
CC inflammatory disease (e.g. psoriasis, rheumatoid arthritis,
CC glomerulonephritis, asthma, thrombosis, cardiac reperfusion injury, renal
CC reperfusion injury, ARDS, adult respiratory distress syndrome,
CC inflammatory bowel disease, Crohn's disease, ulcerative colitis,
CC periodontal disease; also bacterial infection, viral infection and M5 is
CC useful for treating one of the above conditions. The present
CC sequence represents a gene differentially expressed in granulocytes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cc activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and ct treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) CC supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54942 to AAK94950 and AAM82169 CC careers are second in the account of the capture of the protein in the account of the capture of the protein capture.

C
               cc encoding human secreted proteins (II). (I) and (II) are used to prevent, cc treat or ameliorate a medical condition in e.g. humans, mice, rabbits, cc goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in cc inappropriate expression of secreted proteins. (I) and complementary cc sequences may also be used as DNA probes in diagnostic assays (e.g. cc polymerase chain reactions (PCR)) to detect and quantitate the presence cc of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of antibodies and in assays to identify modulators captured and antagonists of the expression and activity of the secreted proteins. The anti-(II) antibodies and antagonists may also be used as diagnostic agents for detecting the presence of (II) in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The classory to include for example: immune/autoimmune diseases (e a urrundiscrete in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and multiple sclerosis), cancers and hyperproliferative disorders (e.g. melanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease), neurological diseases (e.g. Alzheimer's disease, Parkinson's disease and Charoct-Marie-Tooth disease), cardio-/cerebrovascular disorders (e.g. cardiac arrest, tachycardia, angina and thrombosis), infections caused by bacteria, viruses and fungi and ocular disorders (e.g. corneal infections). (I) and (II), agonists, antagonists and antibodies can also be used to promote wound healing, maintain organs before transplantation, and support cell culture of primary tissues. AAS33043-AAS3486 represent human secreted protein coding sequences, PCR primers, and related sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8587

(I) have cytostatic cactivity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the CC diagnose and treat immune/haematopoietic-derived cells. AAK64703 CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK84942 to AAK84950 and AAM82169 CC represent segmences a mead in the arrange of the access of the AAK84942 to AAK84950 and AAM82169 CC represent segmences and mead in the arrange of the access of the AAK84942 to AAK84950 and AAM82169 CC represent segmences and cancer invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthitis and ulcerative
                                                                          6083
                                                                                                                                                                      6023
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia an epilepsy; and (f) infectious diseases such as viral, bacterial, fung and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                    Sequence 32192
                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent printed specification, but was obtained from WIPO at ftp.wipo.int/pub/published_

                                                                                                                                                            The present invention provides the protein and coding sequences of number of human reproductive system related antigens. These can be in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encorprotein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Organ: eye; Vector: pT73-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; UT-E-CRI is a normalized cDNA ilbrary containing the following tissue(s): eye anterior segment. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT73-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AATGCCGCAT. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
